**Notes:**

- When measuring output ripple, it is recommended that an external 1.0 µF ceramic capacitor be placed from the +Vout pin to the -Vout pin for single output units and from each output to common for dual output units.
- Transient recovery is measured to within a 1% error band for a load step change of 75% to 100%.
- Operation at no-load will not damage these units. However, they may not meet all specifications.
- Dual output units may be connected to provide a 10 VDC, 24 VDC or 30 VDC output. To do this, connect the load across the positive (+Vout) and negative (-Vout) outputs and float the output common.
- With the addition of a simple input Pi filter, the unit should meet the conducted emissions requirements of EN55022 class A. Typical component values would be 2.2 µF/100V for the two capacitors and 12 µH for the inductor. The filter components should be mounted as close to the unit as possible.
- It is recommended that a fuse be used on the input of a power supply for protection. See the table above for the correct rating.

**Remote ON/OFF (Optional, see below)**

Parameter	Min	Max	Units
Supply On	3.0	12 or Open	VDC
Supply Off	0.0	1.2	VDC
Standby Input Current	5 mA Typical		
Control Common	Referenced to Neg. Input (pin 2)		

**Output Trim (Single Output Models)**

A simple external circuit may be used to adjust the converter output. To adjust the output DOWN, connect a 5%, 3W resistor between the plus output pin and the Vout trim pin. To adjust the output UP, connect a 5%, 3W resistor between the minus output pin and the Vout trim pin.

For UP/Down trimming capability, connect a 10 kW potentiometer between the plus and minus outputs with the wiper arm connected to the Vout trim pin.

Care should be taken that the maximum output power of the unit does not exceed the maximum rating.

Trim Down	-5%	-10%	Units
Vout =	11.400	10.800	VDC
Rtrim - Down =	38.591	5.264	kΩ
Trim Up	+5%	+10%	Units
Vout =	12.600	13.200	VDC
Rtrim - Up =	63.489	22.094	kΩ
