Notes:

- For 3.3VDC output models, the maximum load regulation is $\pm 0.8\%$.
- When measuring output ripple, it is recommended that external $1.0\ \mu\text{F}$ & $10\ \mu\text{F}$ capacitors be placed in parallel from the +Vout pin to the -Vout pin for single output units and from each output to common for dual output units.
- Transient recovery is measured to within a 1% error band for a load step change of 50% to 100%.
- If the on/off pin is left open, the unit operates. If grounded, the unit will shut off.
- Sense pins should be connected to the output load or to the corresponding output pin.
- No load operation will not damage these units, but they may not meet all spec's.
- It is recommended that a fuse be used on the input of a power supply for protection. See the table above for the correct rating.

Pin Connections

Pin	Function	Pin	Function
1	+VIN	5	+Sense
2	-VIN	6	+VOUT
3	On/Off	7	-VOUT
4	-Sense	8	Trim

External Trim

A simple external circuit may be used to adjust the converter output. To adjust the output DOWN, connect a 5%, 3W resistor between the plus output pin and the Vout trim pin. To adjust the output UP, connect a 5%, 3W resistor between the minus output pin and the Vout trim pin.

For UP/Down trimming capability, connect a 10 kW potentiometer between the plus and minus outputs with the wiper arm connected to the Vout trim pin.

The range for the external trim is about $\pm 10\%$.

Mechanical Dimensions

Mechanical Notes:

- All dimensions are typical in inches (mm)
- Tolerance x.xx = ± 0.01 (± 0.25)
